

3 Reasons

to Move to Composite Paper Cartridges for Sealants and Adhesives

1 More sustainable than plastics

Composite paper cartridges are made from FSC-accredited papers and tinned steel, with just 10% of the cartridge being plastic.

They also breakdown much faster compared with standard plastic cartridges which take up to 500 years in landfill.

2 Save time and costs by using existing filling machines

These cartridges work with your existing equipment – so it's quick, easy and inexpensive to make the change to composite paper.

The process of filling these cartridges is also exactly the same as plastic and fit into pre-existing and widely used skeletal guns.

3 A range of options to meet different product needs

A wide range of fill volumes available, including 310ml, 350/380ml and 900/1000ml.

A choice of 2 internal diameters and either a fixed spout or spigot top. Also a variety of print options are available so products can be fully branded up to 6 colours with additional decorative options.
